

## Dermatology Day Treatment Clinic

### Advice for patients receiving multi-layer bandaging for compression therapy

- The bandages may feel tight or firm for the first few hours. This should loosen over the first day.
- Do not push bandages down from the knee or up away from the toes. This may cause them to become tighter and more uncomfortable.
- Do not get the bandages wet – there are water-proof appliances available. Please ask the Nurse for details.
- Please wear the shoe provided to make sure the bandages are kept clean. This will also help you to walk safely.
- The top layer of bandages can be removed if you develop **any** of the following:
  - A worsening of existing pain or development of new pain.
  - A significant change in colour to the tips of toes (mottled/bluish-purple).
  - Numbness in the bandaged leg or the tips of the toes.
  - Tips of toes become very cold.
  - You notice that you have become short of breath – please also contact your nurse immediately.
